# 설명자료

YOLOv5 & DeepSORT Training

#### 1. Yolo training

#### 2. Feature extractor training (DeepSORT training)

### Corner point training

- 1. Yolo training
- 2. DeepSORT refinement training
- 3. <a href="https://github.com/JunhyeokRui/training">https://github.com/JunhyeokRui/training</a> README 참고

# 1. YOLO training

- 목적: YOLO performance 향상
- Dataset structure
  - AVM\_center\_data\_4class → dataset (이름)
  - trial\_A, B, C... → 각각 다른 주차 시나리오의 dataset
  - Labels → 이미지에서 corner point x y 좌표, corner point 타입

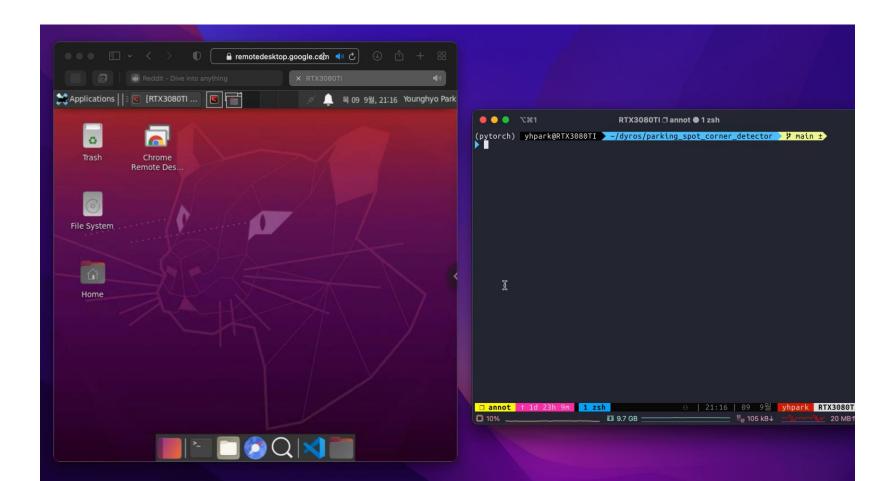

#### Training

- a. Annotation
- **b. Split**(train/test/validation)
- c. Training

```
AVM center data 4class
   Images
       trial A
           image_001.jpeg
          - image 002.jpeg
       trial B
       trial C
    Labels
      - trial A
          image 001.txt
           image 002.txt
       trial B
       trial C
    README.md
```

#### 1-a. Annotation - YOLO training

• AVM 이미지에 marking point 클릭 전, 키보드로 marking point 종류 선택 option(A = outer ,S = inner ,D = outer aux, F = inner aux)

#### 1-b. Split - YOLO training

- 주차 실험 episode 별로 train / test / validation 분할
- parser(option) --train A,B,C --valid D,E --test F 입력 시 data 폴더에 split\_ABC\_DE\_F.yaml 생성
- 예시

```
coco.yaml
                  coco128
                          GlobalWhe
                                  Objects365
                                           old.yaml
                                                   SKU-110K
 HD.yaml
                   yaml
                           at2020.
                                    .yami
                                                    yaml
         DE_F.yaml.
                          E F.yaml
                                   yaml
                  E.yaml
        [out, in, aux out, aux in]
nc: 4
test: ./data/dyros/split ABC DE F.yaml/valid.txt
train: ./data/dyros/split ABC DE F.yaml/train.txt
val: ./data/dyros/split ABC DE F.yaml/test.txt
```

# 1-c. Training - YOLO training

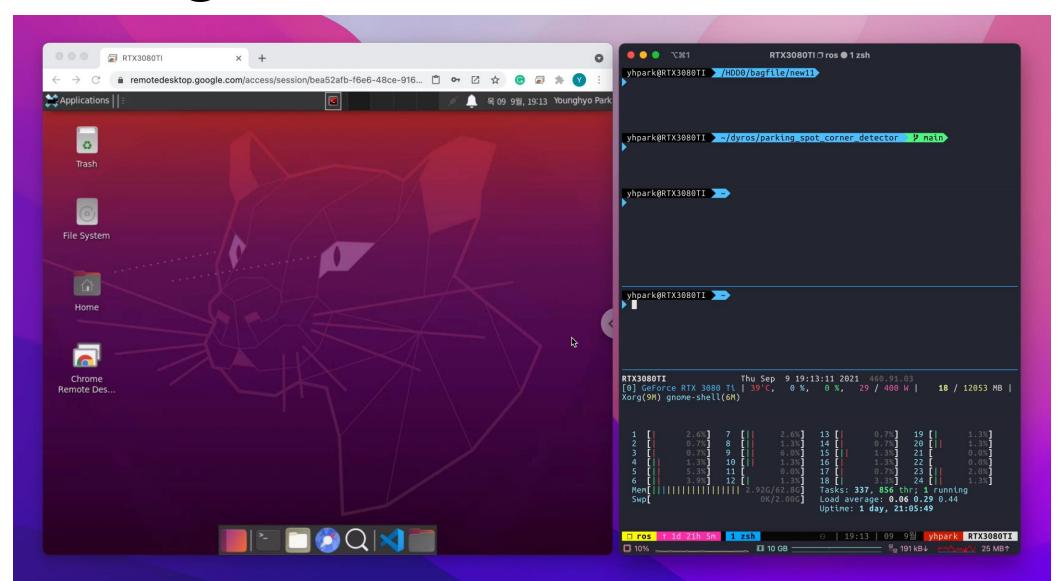

• trained weight 이 ./runs/train/yourexperiment/last.pt, best.pt 로 저장됨

• best.pt 트레이닝 동안의 best weights.

last.pt last epoch weights.

• □-view-img parser(option) 로 opencv window 통해 live result 볼 수 있음

### Marking Point Detection Workflow

### 2. DeepSORT training

- 목적: corner point ID switching을 줄이기 위해서
- Dataset structure
  - dyros\_deepsort\_dataset → dataset (이름)
  - cropped\_30 → cropped 사이즈
  - trial\_A, B, C... → 각각 다른 주차 시나리오의 dataset
  - point\_1, 2, 3... > 각 corner point 분류

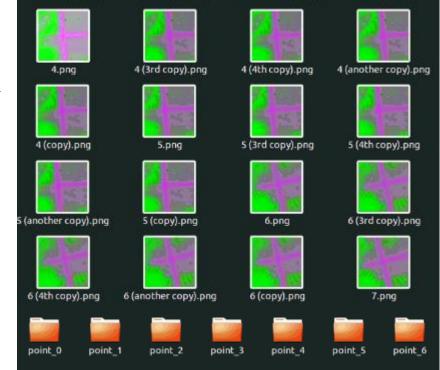

#### Training

- **a. Annotation** (cropped image of points)
- **b. Training** (Siamese training)

```
point 3
pixel labels
        point 2
        point 3
```

#### 2-a. Annotation(cropped image of points) - DeepSORT training (refinement)

- Cropped image 예시 > corner points
- Annotation point by point 로 진행됨.
- Corner point x y 좌표 <del>></del> dataset/pixel\_labels/trial\_A 폴더에 저장
- --crop-only parser for cropping corner points only(corner point x y 좌표 생기지 않음)

#### 2-b. Training(Siamese training) - DeepSORT training(refinement)

- 트레이닝 시작 전 siamese\_training.py 65번째 줄 dataset 경로 확인
- 요구하는 성능, 환경에 따라 hyperparameter 튜닝 필요

- ./deep\_sort\_pytorch/deep\_sort/deep/experiment\_name.pth' 경로에 .pth 파일 저장됨
- detect or ROS\_track\_marking\_points.py 의 -refinements\_weight parser 로 사용함.
